

Simple chain:

The change step-transition is always repeated.

Example:

A sequence from step S3 to S4 only takes place if step S3 is in an active state and the transition condition c is fulfilled.

Branching in case of chain selection:

A selection between several chains is displayed by as many transition symbols **under** the horizontal line, as different possible sequences are present.

Example:

A sequence from S5 to S6 may take place only, if S5 is active and the transition condition e is fulfilled, or from S5 to S7 only if S5 is active and f is fulfilled.
